PROFESSIONAL SUMMARY

Backend developer focused on Node.js, Express, and PostgreSQL, with production experience building 40+ REST APIs, designing an 84-table relational schema, and implementing JWT/RBAC across 8 user roles during a 5-month internship. Independently built and launched SaaS products with Redis/BullMQ-based job processing, Razorpay subscriptions, and real paying users.

EDUCATION

Master of Computer Applications (MCA) Kristu Jayanti College, Bangalore	2024 – 2026
B.Sc. Information Technology Kaziranga University, Assam	2021 – 2023

SKILLS

Backend Development:	Node.js, Express.js, REST APIs, TypeScript, Python, PHP
Languages:	JavaScript (Node.js), PHP, Python, Java
Databases:	PostgreSQL, MySQL, MongoDB
DB Skills:	Schema Design, Indexing, Foreign Key Constraints, Transactions
Authentication & Security:	JWT, OTP Authentication, Role-Based Access Control (RBAC)
Architecture:	REST API Design, MVC / Layered Architecture, Input Validation
Async & Infrastructure:	Redis, BullMQ, Linux
Tools:	Git, GitHub, Postman, Jira, Vercel, Linux, Microsoft Azure
Core CS:	DSA, OOP, DBMS

EXPERIENCE

Backend Developer Intern — Jeffs Group of Companies, Bengaluru <i>SportERP / NexSport Platform</i>	Feb 2026 – Jun 2026
- Built and maintained 40+ REST APIs across athlete, event, scoring, and registration modules for an 8-role sports ERP platform (Athlete, Coach, School Admin, Organizer, and others). - Proposed and executed a MongoDB-to-PostgreSQL migration, designing an 84-table relational schema with enforced foreign key constraints to support the system's structured data and JOIN requirements. - Designed and implemented JWT-based RBAC across all 8 roles with route-level and resource-level ownership checks; structured the codebase into a layered architecture (routes/controllers/services/repositories) by domain module. - Built competition engine APIs for match-based and race-based sports, including score validation, qualifier calculation, and idempotent player advancement logic.	
Freelance Backend Developer	Jan 2024 – Jan 2026 (alongside academics)
- Built and delivered production backend systems for clients using PHP and Python (Flask), including REST APIs, admin dashboards, and database-driven workflows. - Designed normalised MySQL schemas and implemented authentication, role-based access control, and CRUD operations with input validation. - Worked directly with clients to gather requirements and iterate on features through delivery.	

PROJECTS

SnipShare — Code Snippet Sharing Platform

2026

devbyaryan.me github.com/AFG123/Snip-share

Tech: Node.js, Express, PostgreSQL, Vercel, render, neon

Problem: Sharing code snippets online meant either using bloated tools or having no control over who sees them or for how long.

Solution: Built a lightweight Pastebin-alternative with burn-after-read, password protection, configurable expiry, and IP watermarking. Designed schema and API from an SRS document before writing any code.

Challenge: Burn-after-read had to be atomic, used a DB transaction wrapping the read and delete together so a snippet could never be read twice even under concurrent requests.

Why PostgreSQL: Needed transactional guarantees for BAR logic MongoDB's eventual consistency wasn't an option here.

ProjectPilot — AI-Powered Project Blueprint Platform

2026

projectpilot.devbyaryan.me github.com/AFG123/ProjectPilot

Tech: Node.js, Express, PostgreSQL, CloudFlare, railway, neon

Problem: Computer science students often build repetitive portfolio projects and struggle to design production-ready applications from scratch.

Solution: Built a SaaS platform that generates personalized software project blueprints based on a student's skills and target role. Each blueprint includes prerequisites, system architecture, folder structure, relational database schema, REST API endpoints, phased implementation guide, deployment recommendations, and role-specific interview questions.

Impact: Publicly launched with real paying users and Razorpay-integrated premium subscriptions. Bridges the gap between tutorial-following and building production-ready applications from scratch.

ReachInbox Email Scheduler

2026

reachinbox-email-scheduler-gules.vercel.app github.com/AFG123/reachinbox-email-scheduler

Tech: TypeScript, Express.js, PostgreSQL (Prisma), BullMQ, Redis, React (Vite), Passport.js, Tailwind CSS

Built a full-stack email campaign scheduler with Google OAuth, CSV/text lead parsing, and a live status dashboard.

- Used BullMQ delayed jobs with Redis-backed persistence, allowing scheduled jobs to survive server restarts without relying on cron.
- Implemented Redis-backed hourly rate limiting per sender, automatically rescheduling jobs when limits are reached, with configurable per-sender send delays.
- Added database-tracked job states (PENDING/PROCESSING/SENT/FAILED) and status checks to prevent duplicate processing when multiple workers handle jobs concurrently.

CERTIFICATIONS

- Microsoft Azure Fundamentals
- Java DSA – Apna College
- Unix/Linux Fundamentals – Infosys Springboard
