PROFESSIONAL SUMMARY

Backend developer completing MCA (2026) with 5 months of production internship experience building a multi-role sports ERP platform. Built and shipped 40+ REST APIs across multiple modules, contributed to an 70+ PostgreSQL schema, and implemented Role-Based Access Control across 8 user roles with OTP and JWT authentication. Hands-on with Node.js, Express, and relational database design in a real team environment.

EDUCATION

Master of Computer Applications (MCA) Kristu Jayanti College, Bangalore CGPA (upto 1st year): 7.1 / 10	2024 – 2026
B.Sc. Information Technology Kaziranga University, Assam Percentage: 70	2021 – 2023

SKILLS

Backend Development:	Node.js, Express.js, PHP, Python (Flask)
Languages:	JavaScript (Node.js), PHP, Python, Java
Databases:	PostgreSQL, MySQL, MongoDB
DB Skills:	Schema Design, Relational Modeling, Indexing, Foreign Key Constraints
Authentication & Security:	JWT, OTP Authentication, Role-Based Access Control (RBAC)
Architecture:	REST API Design, MVC / Layered Architecture, Input Validation
Tools:	Git, GitHub, Postman, Jira, Vercel, Linux, Microsoft Azure
Core CS:	DSA, OOP, DBMS

EXPERIENCE

Backend Developer Intern — Jeffs Group of Companies, Bengaluru <i>SportERP / NexSport Platform</i>	Feb 2026 – Jun 2026
- Contributed to backend development of a sports ERP platform supporting 8 user roles — Athlete, Coach, School Admin, Organizer, Sports Coordinator, Event Admin, Event Official, and Super Admin. - Built and maintained 40+ REST APIs across athlete, event, scoring, and registration modules; coordinated API contracts with the frontend team to align request/response shapes before implementation. - Proposed and executed a database migration from MongoDB to PostgreSQL, identifying that the system’s structured, relational data model required enforced schemas, foreign key constraints, and JOIN support. Final schema grew to 84 tables across all modules. - Designed and implemented RBAC across all 8 roles using JWT-based authentication and Express middleware, enforcing both route-level role checks and resource-level ownership checks. - Structured the codebase into a modular layered architecture — routes, controllers, services, repositories — organised by domain module, keeping business logic cleanly separated from HTTP and database layers. - Built competition engine APIs for match-based sports (Badminton, Pickleball) and race-based sports (Athletics, Swimming), including score validation, qualifier calculation, and idempotent player advancement logic. - Set up a protected main/dev Git branching strategy and coordinated backend module ownership across a 3-person backend team.	

- Built and delivered production backend systems for clients using PHP and Python (Flask), including REST APIs, admin dashboards, and database-driven workflows.
- Designed normalised MySQL schemas and implemented authentication, role-based access control, and CRUD operations with input validation.
- Worked directly with clients to gather requirements and iterate on features through delivery.

PROJECTS

SnipShare — Code Snippet Sharing Platform

2025

devbyaryan.me github.com/AFG123/Snip-share*Tech: Node.js, Express, PostgreSQL, Vercel, render, neon*

Problem: Sharing code snippets online meant either using bloated tools or having no control over who sees them or for how long.

Solution: Built a lightweight Pastebin-alternative with burn-after-read, password protection, configurable expiry, and IP watermarking. Designed schema and API from an SRS document before writing any code.

Challenge: Burn-after-read had to be atomic, used a DB transaction wrapping the read and delete together so a snippet could never be read twice even under concurrent requests.

Why PostgreSQL: Needed transactional guarantees for BAR logic MongoDB's eventual consistency wasn't an option here.

ProjectPilot — AI-Powered Project Blueprint Platform

2025

projectpilot.devbyaryan.me

Tech: Node.js, Express, PostgreSQL, cloudflare, railway, neon

Problem: Computer science students often build repetitive portfolio projects and struggle to design production-ready applications from scratch.

Solution: Built a SaaS platform that generates personalized software project blueprints based on a student's skills and target role. Each blueprint includes prerequisites, system architecture, folder structure, relational database schema, REST API endpoints, phased implementation guide, deployment recommendations, and role-specific interview questions.

Impact: Publicly launched with early active users and a premium subscription for detailed implementation guides.

Wedding Card Portfolio Platform — Freelance

2024

houseofcards.in

Tech: PHP, MySQL, HTML, CSS, JavaScript

Problem: A local wedding card business had no online presence — customers were only coming through word of mouth with no way to showcase the full catalogue.

Solution: Built a product showcase website to display their card designs and drive discovery. The site brought in 30 to 50 new customers from different cities, with enquiries handled directly via WhatsApp. Built an authentication-protected admin panel for the client to manage and update the catalogue without touching code.

CERTIFICATIONS

- Microsoft Azure Fundamentals
- Java DSA – Apna College
- Unix/Linux Fundamentals – Infosys Springboard
